Beckmann Converting, Inc. is a world leading toll laminator serving customers making textile products for diverse industries and applications.

Utilizing ultrasonic bonding processes exclusively, the company converts continuous, wide web, roll-to-roll customer owned technical materials into multiple layer high performance textile composites. Our customers rely upon Beckmann Converting to laminate their textile composite packages cost effectively and with consistent, test verified quality.

Through long term supply agreements, Beckmann Converting executes major high volume ultrasonic laminating programs for our customers. Our equipment is designed for efficient changeover to run lower volume specialty laminate programs as well.

With 30 plus years of experience in ultrasonic laminating, we deliver the lowest Total Cost solution to our customers. They often avoid expensive investment in plant and equipment by having us meet their lamination needs. We often hear from our customers that the finished laminates we deliver are better quality and higher consistency than they can achieve internally. We can supplement or takeover production requirements with rapid validation and ramp-up to meet volume needs.

Our service begins early in the New Product Development cycle supporting customer Research & Development teams. As product design emerges, our staff provides guidance on the potential to achieve desired laminating results. Hand Trials are run, bonding sample sets right on our production equipment rather than in the lab. When a package with promise is identified, we run one

or more Roll Trials with the goal of developing a laminating process that optimizes the quality and cost of the finished product. Right through initial commercial production runs, the customer can have confidence that Beckmann Converting is their dedicated custodian of the manufacturability of their products when it comes to laminating.

Beckmann Converting operates on a fully

registered ISO9001:2015 Quality Management Program. Product testing is performed at the machine by production crew members and in our onsite Quality Control Lab by our technicians to ensure that every length of finished material meets the specification requirements of our customers.
